Compressing Pre-trained Models of Code into 3 MB

Jieke Shi, Zhou Yang, Bowen Xu, Hong Jin Kang, David Lo

 Motivation: Pre-trained models of code achieved great suc model sizes and high response latency; For modern IDE or editor design, 3 MB model second latency are preferred modern IDE or editor 	ccess but have hugeContribution:size and 0.1• Compressor, a nove (GA)-guided modeditor design [1, 2].• Evaluate Compress two downstream tage	el compression method via genetic algorithm l simplification and knowledge distillation. <i>or</i> with CodeBERT and GraphCodeBERT across asks. The results validate the effectiveness.			
	Methodology				
	Hyperparamete	r Pre-trained Models Search Space			
Search	number of network	ayers 12 [1, 12]			
	dimensionality of netwo	ork layers 768 [16, 768]			
	number of attention	heads 12 1, 2, 4, 8			
Model Simplification	Small model dimensionality of feed-for	ward layers 3072 [32, 3072]			
▲ Knowled	ge 🛉 vocabulary size	50265 [1000, 50000]			
distillatio	Search space	Search space of GA-guided model simplification			
Query	Fitne Fitn	$Fitness(s) = GFLOP \ s - t_s - T $ Fitness function of GA-guided model simplification			
Pre-trained model Un	Unlabeled data $\mathcal{L} = -\frac{1}{n} \sum_{i} softmax(\frac{p_i}{T}) \log\left(softmax(\frac{q_i}{T})\right) T^2$				

Knowledge distillation loss function

RQ3: How fast is *Compressor* in compressing pre-trained models? Answer: Compressor only incurs 30.39% and 37.06% additional time to the fine-tuning time, which we believe to be reasonable.

RQ2: How much efficiency improvement can the compressed models obtain?

Answer: Compressed CodeBERT and GraphCodeBERT are 4.31× and 4.15× faster than the original model at inference.
